# Introduction

- Graph Databases
- Key concepts
- What is Wikidata?
- Example data
- Querying Wikidata with SPARQL
- How to get involved
- Useful resources

# Graph Databases vs Relational Databases

## RDBMS

- Tables
- Schema
- Linking of tables
- Normalisation
- (Primary) keys
- Table Joins
- SQL

## Graph DB

- Nodes (items)
- Edges (relationships)
- Schema-less
- Nodes and edges have properties
- Ad hoc additions
- SPARQL / CYPHER

# The RDF triple

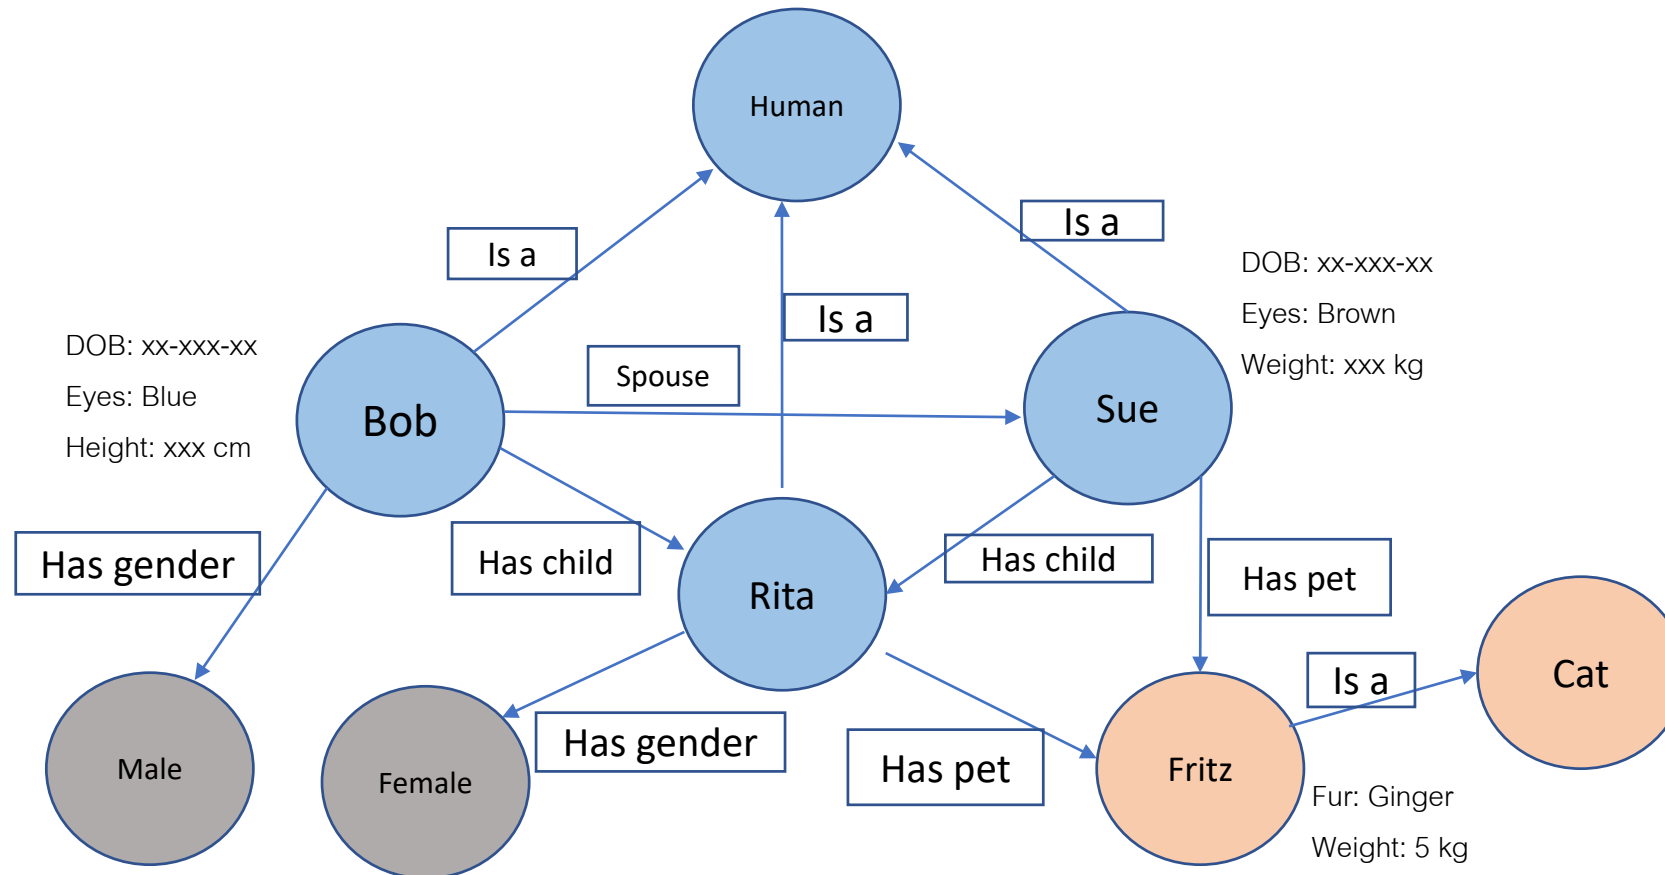

In Linked Data we express the relationships as follows.

[This Photo](#) by Unknown Author is licensed under [CC BY-SA](#)

Applying this to our graph data we can say that Node A (subject) has a relation (predicate) of / to Node B (object)

# Meet the family

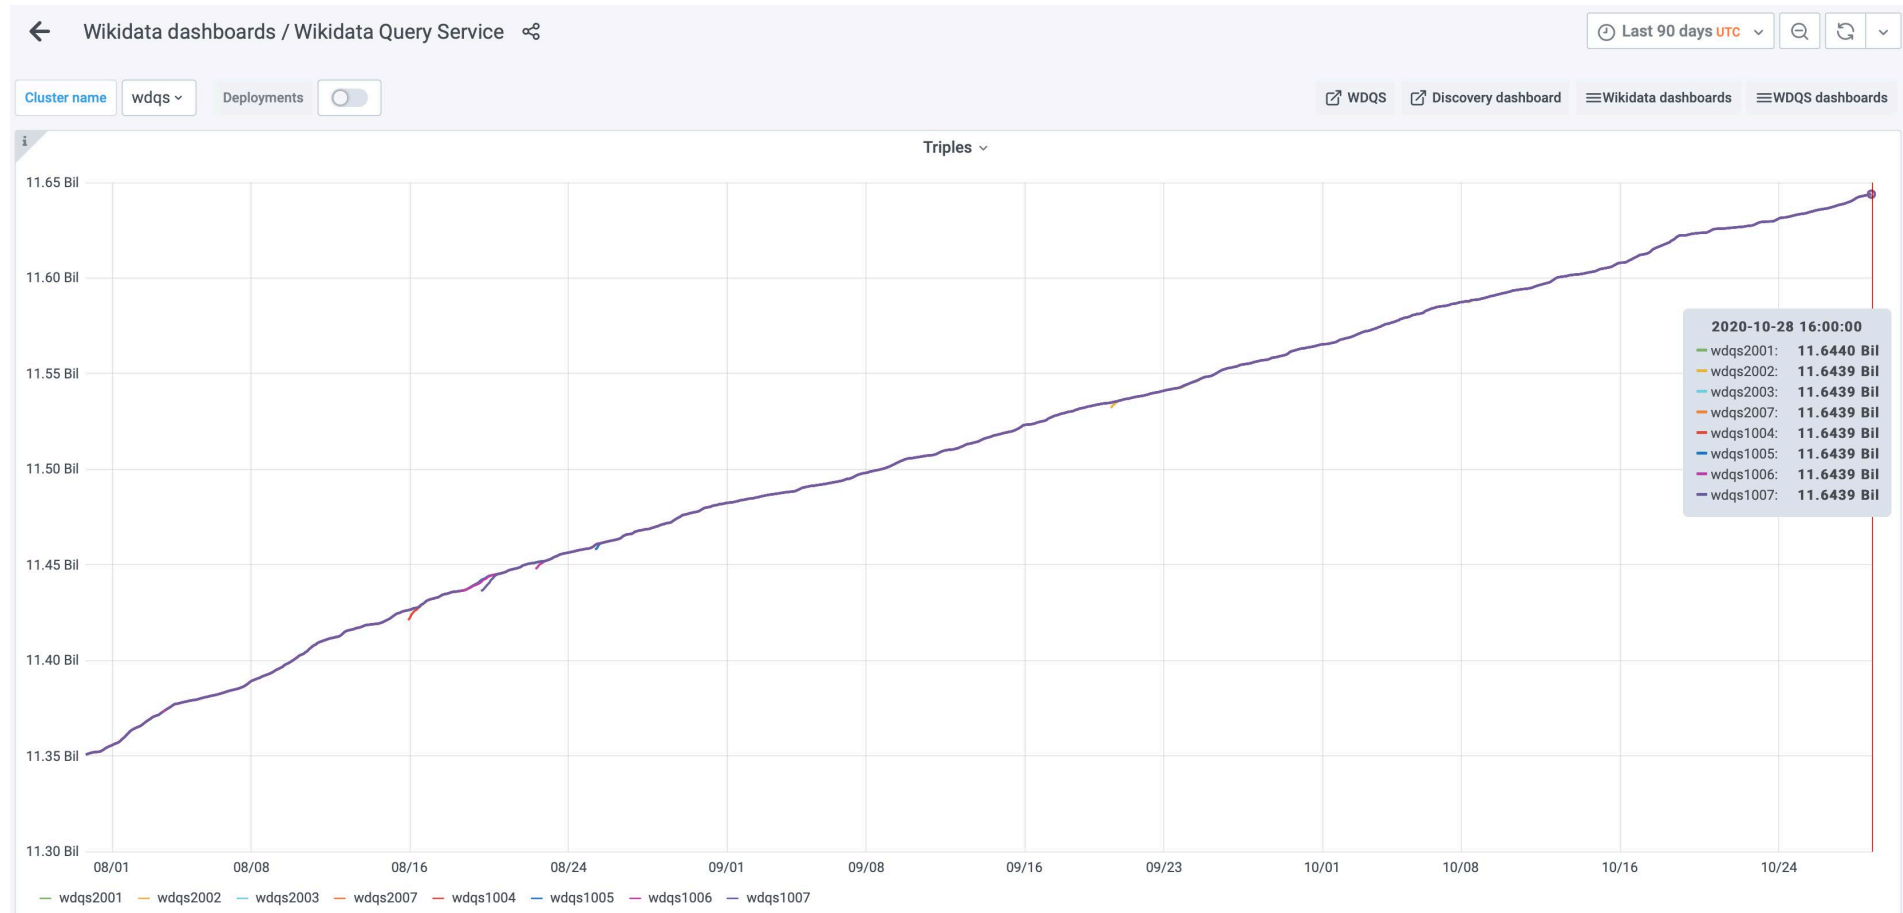

# What is Wikidata?

# Querying Wikidata

The screenshot shows the Wikidata Query Service interface. At the top, there is a header bar with the Wikidata logo, the text "Wikidata Query Service", and three buttons: "Examples", "Help", and "More tools". Below the header is a text area containing a SPARQL query. To the left of the text area is a vertical toolbar with icons for information, edit, pin, diamond, folder, undo, redo, and a large blue play button at the bottom. The query text is as follows:

```
1 #Table of locations of all hospitals in Aberdeen|
2 SELECT * WHERE {
3
4 ?item wdt:P31/wdt:P279* wd:Q16917;
5       wdt:P625 ?geo .
6 ?item wdt:P131 wd:Q62274582 .
7 }
```
